## 0.1 Module Introduction

This package is an OCaml interface for the GMP interface, which is decomposed into 7 submodules, corresponding to C modules:

- : GMP integers, with side-effect semantics (as in C library)
- : GMP rationals, with side-effect semantics (as in C library)
- : GMP multiprecision floating-point numbers, with side-effect semantics (as in C library)
- : GMP integers, with functional semantics
- : GMP integers, with functional semantics
- : GMP random number functions
- : MPFR multiprecision floating-point numbers, with side-effect semantics (as in C library)
- : MPFR multiprecision floating-point numbers, with functional semantics

There already exists such an interface, `mlgmp` [<http://www.di.ens.fr/~monniaux/programmes.html.en>], written by D. Monniaux. The motivation for writing a new one in the APRON project were

1. The fact that `mlgmp` provides by default a functional interface to GMP, potentially more costly in term of memory allocation than an imperative interface. `mlgmp` provides only a relative small numbers of functions in an imperative version.
2. The compatibility with the CamlIDL tool. `MLGmpIDL` uses CamlIDL, so that other OCaml/C interfaces written with CamlIDL may reuse the `MLGmpIDL .idl` files.

## 0.2 Requirements

- GMP library (tested with version 4.0 and up)
- MPFR library (optional, tested with version 2.2.x)
- FINDLIB/ocamlfind
- OCaml 3.0 or up (tested with 3.09 and 3.10)
- Camlidl (tested with 1.05)

## 0.3 Installation

- Set the file `Makefile.config` using the `Makefile.config` model to your own setting. You might also have to modify the `Makefile` for executables

If you download from the subversion repository, type `'make rebuild'`, which builds `.ml`, `.mli`, and `_caml.c` files from `.idl` files.

type `'make'`, possibly `'make debug'`, and then `'make install'`

The OCaml part of the library is named `gmp.cma`, (`.cmxa`, `.a`). The C part of the library is named `libgmp_caml.a`, `libgmp_caml.so/dllgmp_caml.so`.

`'make install'` installs not only `.mli`, `.cmi`, but also `.idl` files.

Be aware however that importing those `.idl` files from other `.idl` files will probably request the application of SED editor with the scripts `sedscript_caml` and `sedscript_c` (look at the `Makefile`).

- **Interpreter and toplevel**

With dynamic linking, you can use ordinary runtime `ocamlrun` and `toplevel`.

You can play with `session.ml`, and compile it with `'make session.byte'`, `'make session.opt'`.

- **Documentation**

The documentation is generated with `ocamldoc`.

`'make mlapronidl.dvi'`

`'make html'` (put the HTML files in the `html` subdirectoy)

- **Miscellaneous** `'make clean'` and `'make distclean'` have the usual behaviour.

`'make mostlyclean'`, in addition to `'make clean'`, removes the `.ml`, `.mli` and `_caml.c` files generated from `.idl` files.

## 0.4 Module `Mpz`

```
type 'a tt
```

GMP multi-precision integers

```
type m
```

Mutable tag

```
type f
```

Functional (immutable) tag

```
type t = m tt
```

Mutable multi-precision integer

The following operations are mapped as much as possible to their C counterpart. In case of imperative functions (like `set`, `add`, ...) the first parameter of type `t` is an out-parameter and holds the result when the function returns. For instance, `add x y z` adds the values of `y` and `z` and stores the result in `x`.

These functions are as efficient as their C counterpart: they do not imply additional memory allocation, unlike the corresponding functions in the module `Mpzf`[0.61].

val set_str : t -> string -> base:int -> round -> unit
val _strtoufr : t -> string -> int -> round -> int * int
val strtoufr : t -> string -> base:int -> round -> int * int

```

As MPFR's `strtoufr`, but returns a pair  $(r,i)$  where  $r$  is the usual ternary result, and  $i$  is the index in the string of the first not-read character. Thus,  $i=0$  when no number could be read at all, and is equal to the length of the string if everything was read.
