

**NAME**

**clisp-link** – link a new external module to **CLISP**<sup>[1]</sup>.

**SYNOPSIS**

```
clisp-link [create] [module] [file...]
clisp-link [add] [source] [destination] [module...]
clisp-link [run] [source] [module...]
clisp-link [install] [module...]
```

**DESCRIPTION**

This shell script operates on **CLISP**<sup>[1]</sup> module sets and linking sets:

- **creates** new module sets out of source files
- **adds** module sets to a linking set to produce a new linking set
- **runs** **CLISP**<sup>[1]</sup> with module sets added
- *Only in CLISP<sup>[1]</sup> built without configure flag --without-dynamic-modules.*

**installs** new module sets for general use

**OPTIONS****create**

The command

```
$ clisp-link create module file ...
```

creates a module set in *module* directory which refers (via symbolic links) to files *file...* The files are expected to be modules of their own.

**add**

The command

```
$ clisp-link add source destination module ...
```

combines the linking set in directory *source* and the modules in directories *module...* to a new linking set, in the directory *destination* which is newly created.

**run**

The command

```
$ clisp-link run source module ...
```

runs the linking set in directory *source*, with the modules in directories *module...* Unless **CLISP**<sup>[1]</sup> has been built with the configuration option **--without-dynamic-modules**, the loading will be performed using **SYS::DYNLOAD-MODULES**. Otherwise – this is much slower – a temporary linking set will be created and deleted afterwards.

**install**

*Only in CLISP<sup>[1]</sup> built without configure flag --without-dynamic-modules.*

The command

```
$ clisp-link install module ...
```

installs the modules in directories *module...* into **CUSTOM:LIB-DIRECTORY\*** or, if it is not writable to the user (e.g., if a system-wide **CLISP**<sup>[1]</sup> installation is used and the user does not have

administrative privileges), into *CUSTOM:USER-LIB-DIRECTORY*.

Variable *CUSTOM:USER-LIB-DIRECTORY* is initially set to (**MERGE-PATHNAMES**<sup>[2]</sup> ".clisp/" (**USER-HOMEDIR-PATHNAME**<sup>[3]</sup>)) if that directory exists, and can be reset in the RC file.

#### Note

Do **not** add *CUSTOM:USER-LIB-DIRECTORY* to *CUSTOM:LOAD-PATHS* or under any element thereof. Use **REQUIRE** instead of **LOAD** to load dynamic modules.

For this command to work, each *module* directory must contain a Makefile with a **clisp-module-distrib** target which uses **LN** to distribute the files necessary to run the module into **destdir**. This is in addition to the general requirement that **link.sh** is present.

## EXAMPLES

See Section 32.2.6, “Example”.

## FILES

**clisp-link** needs a “link kit” directory containing:

- "modules.c"
- "clisp.h"

**clisp-link** expects to find these files in a subdirectory linkkit/ of the installation directory (i.e., *CUSTOM:LIB-DIRECTORY*) which it acquires by running

```
$ 'dirname $0'./clisp -b
```

This can be overridden by the **environment variable**<sup>[4]</sup> **CLISP\_LINKKIT**.
